

Codebook for "UN Security Council Membership: Increased Security and Reduced Conflict" --
Alastair Smith and James Vreeland. December 6, 2022

In general our data are compiled from relative well known and established sources. By and large we have used the extant variable names from these sources. For this reason we don't elaborate on such variables and focus instead on the constructed variables.

A brief description of the central variables are below
Monadic data: (monadic_working.dta)

year year
unsc Is the nation in the UNSC as a rotating member (0/1)
ccode COW 3-digit code
UNmember Is nation a member of the UN (0/1)
tm2, tm1, t0, t1, t2, t3 ,t4 are dummy variables that code nation's entry into UNSC. The variables t0 is coded as 1 in the year the nation is elected. T1 and t2 code the first and second year of term on UNSC. T3 and t4 correspond to the years following a nation's term on UNSC. Tm1 and tm2 correspond to the years prior to election to UNSC.
polity2 Polity score
cinc Composite Index of National Capability (CINC) (Singer, Bremer & Stuckey, 1972)
countryname Country Name
growthWB WDI: GDP Per Capita Growth (Annual %) NY.GDP.PCAP.KD.ZG Annual percentage growth rate
lgdppc WDI: Log of GDP Per Capita (Constant 2010 US\$) NY.GDP.PCAP.KD GDP per capita is gross
lpop WDI: Log(population): SP.POP.TOTL
perm P5 member of UNSC (0/1)
cwar UCDP: civil
war UCDP: interstate war
cwarS UCDP: civil war starts
cwarIS UCDP: start of civil war * intensity (1 (25+deaths) or 2 (1000+ deaths))
chGovcwar UCDP: civil war to change government
cwarI UCDP: civil war * intensity (1 (25+deaths) or 2 (1000+deaths))
e_migdppcIn GDP per capita, logged, base 10
e_total_resou~c Petroleum, coal, natural gas, and metals production per capita
logpopVDEM log population from V-Dem data
unsc_ UNSC regions: 0)permanent 1)Africa 2)Asia 3)EEuro 4)WEOG 5)GRULAC 6)No region
regionSeats number of UNSC seats for a nation's region in that year (varies between odd and even years)
n_eligible Number of other countries eligible for the seat.
n_members number of members in UN region
timesinUNSC Cumulative count of the number of times a nation has been in UNSC
timeSince years since nation was last on UNSC
rotate timeSince *regionSeat / n_eligible

odd the year is odd 1981,83,85 etc...

$\text{weightedService} = \text{timesinUNSC} * n_{\text{eligible}} / (\text{regionSeats} * (\text{year} - \text{entryYear} + 1))$

myturn (rotate >= .9)

SCratio Ratio of number of available seats (in the region years) over the number of countries that are available for that seat.

notElection The nation is not available for election: in unsc, not member, or region rotation

P5Ally Is the nation allied with a P5 member

The following variables come from MID data

dispnum int %8.0g
stabb str3 %9s
stday byte %8.0g
stmon byte %8.0g
styear int %8.0g
endday byte %8.0g
endmon byte %8.0g
endyear int %8.0g
sidea byte %8.0g
revstate byte %8.0g
revtype1 byte %8.0g
revtype2 byte %8.0g
fatality byte %8.0g
fatalpre int %8.0g
hiact byte %8.0g
hostlev byte %8.0g
orig byte %8.0g
version byte %8.0g
nobs float %9.0g

sideb=1-sidea;

SIDEA=max(sidea*orig);

SIDEB=max(sideb*orig);

HostA=max(sidea*hostlev);

HostB=max(sideb*hostlev);

OBSperNatYear=_n, is the number of observations per nation year (When greater than one, this implies the number of MIDs a nation was involved in.

Dyadic Data: (working_UNSCdeter.dta)

The data are directed dyads: nation A acts against B in year t.

The tricky part of these data are that there can be more than one mid per year between the dyad: mid=1 implies that a mid occurs between A and B in year t. PrimaryAB implies that A and B where the origin challenger and target nations. The variable obs_num is a running count of

the number of dyad-year observations. The data are sorted such that if there is a mid in the dyad year in which PrimaryAB =1, then the first dyad-year observation corresponds to PrimaryAB =1. In the analyses that consider all mids in a dyad year as separate events then the dependent variables is generally mids=0/1 and includes all obs_num values.

For the analyses that focus on a single dyad-year observation, and asks whether A and B were the originators of the dispute, the dependent variable is primaryAB and the analysis is conditioned on obs_num=1.

Many of the variables are identical to those in the monadic data, with either an A or B corresponding to the pair of nations.

AnyAlly Is there a military alliance between A and B (of any kind: defense, non-aggression, entente etc)
 conttype Contiguity: 1 land, 2 up to 12 miles; 3=13-24 miles;4=25-100 miles; 5=151-400
 kmDIST Distance between capitals

Variables directly from MID data

disno		
dyindex	double %9.0g	dyindex

roleb	byte	%9.0g	roleb
war	byte	%9.0g	war
mids	byte	%9.0g	

primaryAB Coded as 1 if nation A is the primary initiator and if nation B is the primary target.
joiner Nations A and B where not the originators of the dispute but joined on sides A and B
forceratio=cincA/(cincA+cincB);
demautA=(polity2A+10)/20;
dyad = ccodeA*1000+ccodeB;
logdistance=log(1+kmdist);

Concessions data:

Nation A is taken as the challenger in Huth Allee data and nation B is the target.

dvsq1 "Action taken by the challenger: 0 if the challenger takes no action, 1 if challenger initiates negotiations, 2 if challenger initiates a militarized interstate dispute.";

dvneg1 "if engaged in negotiations) Level of territorial concessions made by the challenger in the current round of talks (1=no concessions, 2=limited or some concessions, 3=major concessions)";

dvesc1 "if engaged in a MID) Level of military escalation by the challenger in the current MID (1=low or limited escalation, 2=moderate escalation, 3=high escalation)";

dvneg2 "if engaged in negotiations) Level of territorial concessions made by the target in the current round of talks (1=no concessions, 2=limited or some concessions, 3=major concessions)";

dvesc2 "f engaged in a MID) Level of military escalation by the target in the current MID (1=low or limited escalation, 2=moderate escalation, 3=high escalation)";

APPENDIX

/* Data Organization

Takes constituent data and creates three datasets.

- 1) Monadic Data
- 2) Dyadic data
- 3) Concessions with territorial disputes

The constituent data are organized to create the three datasets for the analysis in OrganizeDataUNSCdeter.do

This program file (written for Stata 17) executes the analyses contained in "UN Security Council Membership: Increased Security and Reduced Conflict" -- Alastair Smith and James Vreeland.

This file provides the code used to assemble the data. It should resolve any ambiguity as to coding decisions. Further, it can be used to update the analysis as soon as update to the constituent data are available.

/** Alliance data *****/
```

```
/*Version 4: Correlates of War Formal Interstate Alliance Dataset, 1816-2012
```

```
Douglas M. Gibler* March 2013
```

```
1 Citation
```

These release notes describe the variables included in Version 4.0 of the data and several of the most important changes since Version 3.* of the alliance dataset (Gibler and Sarkees 2004). A complete codebook and draft of a data release paper will be available at the end of the summer of 2013. Until then, dataset users should cite Gibler (2009) for the Version 4.0 release of the data and may also want to consult the summaries and coding discussions in that work that are available for most of these alliances. Any remaining questions may be directed to Doug Gibler at dmgibler@bama.ua.edu.
